

Introduction

Weizi Li

Department of Computer Science
University of Memphis

- Intelligence is essential to us. We call ourselves *Homo sapiens*—man the wise
- Our brain can perceive, understand, predict, and manipulate a world, which is one of the greatest scientific mysteries

- Artificial Intelligence: build an intelligent agent that can perceive and perform in its environment, while optimizing its outcome

- One of the most interesting and fastest-growing fields (especially in the last decade)
- Over a trillion dollars a year in revenue (= Netherlands's GDP, 17th in the world)
- AI expert Kai-Fu Lee predicts AI's impact will be "more than anything in the history of mankind"
- Not like other fields such as physics, AI research is still wide open

- By 2019, AI has reported to exceed human-level performance on various domains.
- Computer vision: ImageNet object detection
- Language processing: speech recognition in a limited domain
- Biology: skin cancer detection, prostate cancer detection, protein folding, and diabetic retinopathy diagnosis
- Games (classic and video): chess, Go, poker, Pac-Man, Jeopardy!, Quake III, Dota 2, StarCraft II, various Atari games

- Major improvements have been achieved in many other domains: autonomous vehicles (ground and air), planning and scheduling, recommendations, medicine discovery, climate change, ...

- These successes have stimulated huge interest in AI in both academia and industry
- AI papers increased 20-fold between 2010 and 2019 to 20,000 a year; The most popular category is machine learning
- Course enrollment increased 5-fold in the U.S. and 16-fold internationally from a 2010 baseline. AI is the most popular specialization in CS
- AI startups increased 20-fold in the U.S. to over 800
- Machine Learning (especially Deep Learning) is responsible for most of these developments

- Supervised learning
- Reinforcement learning
- Unsupervised learning

- Supervised Learning and Reinforcement Learning contribute to most successes
- Computer vision: ImageNet object detection
- Language processing: speech recognition in a limited domain
- Biology: skin cancer detection, prostate cancer detection, protein folding, and diabetic retinopathy diagnosis
- Games (classic and video): chess, Go, poker, Pac-Man, Jeopardy!, Quake III, Dota 2, StarCraft II, various Atari games

- Uses **labelled data**, hence “supervised”

Labelled data

Dog

Cat

Labelled data

18 lbs

14 lbs

12 lbs

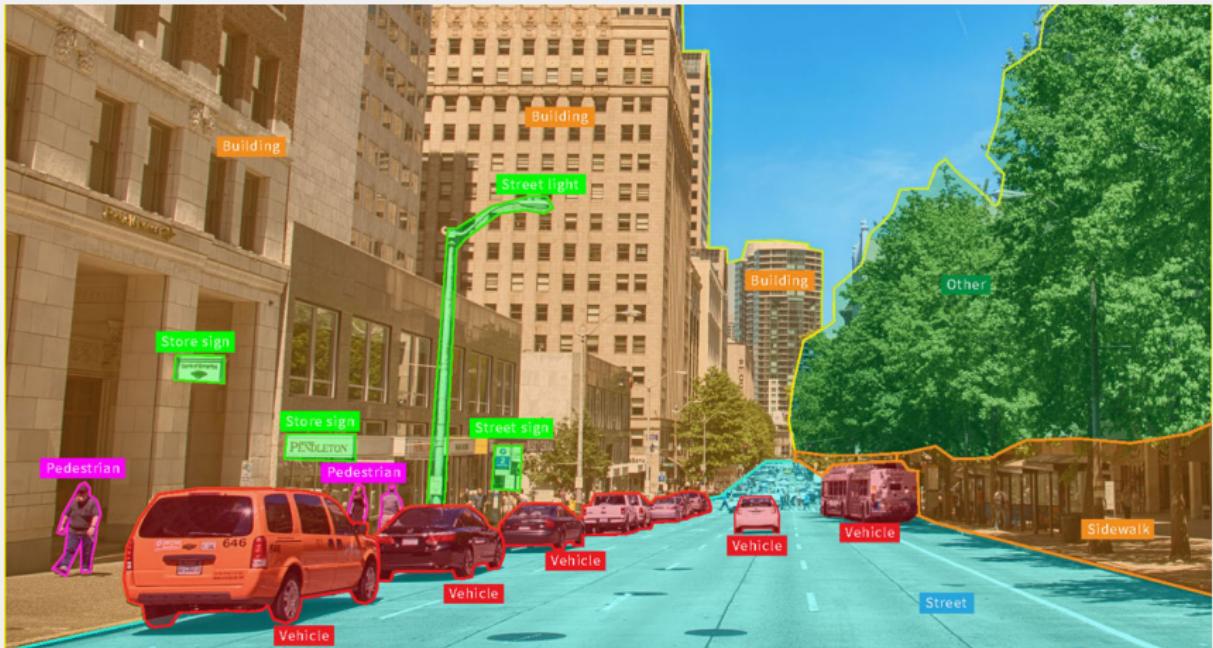

9 lbs

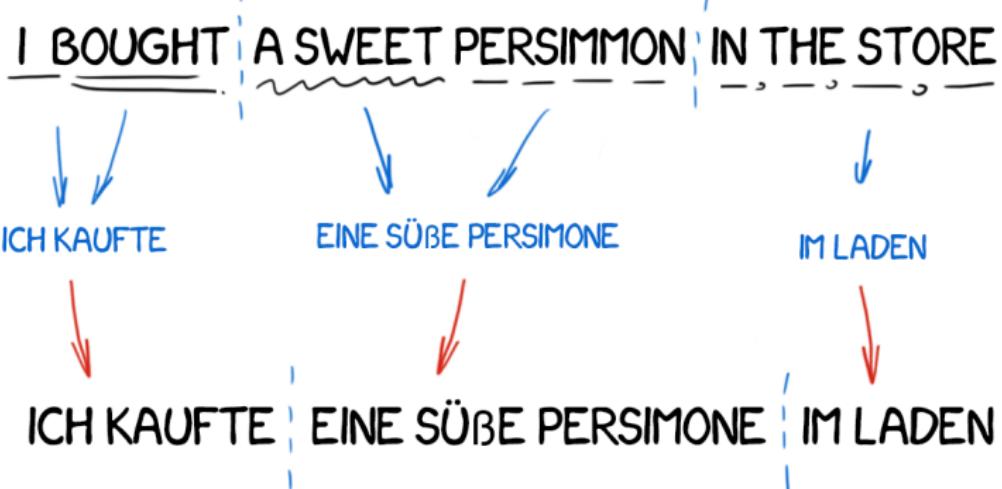

Unlabelled data

Supervised Learning: Labelled Data

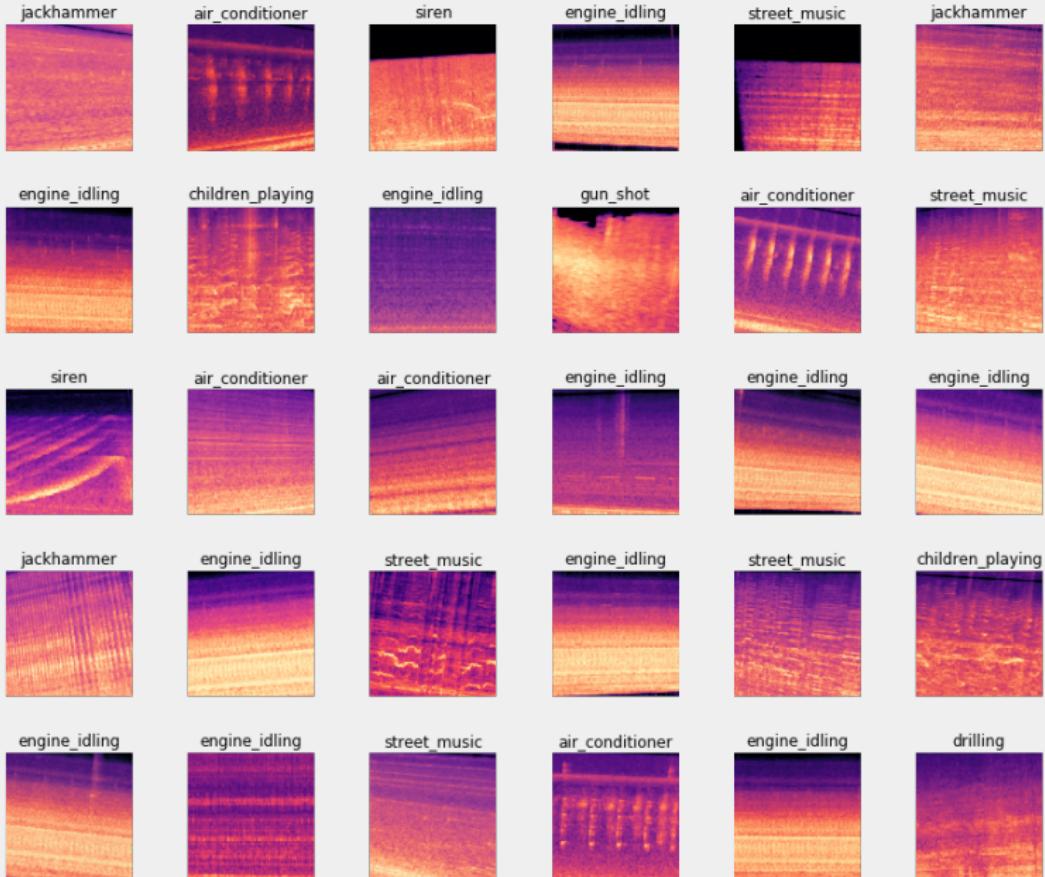

10

Supervised Learning: Labelled Data

12

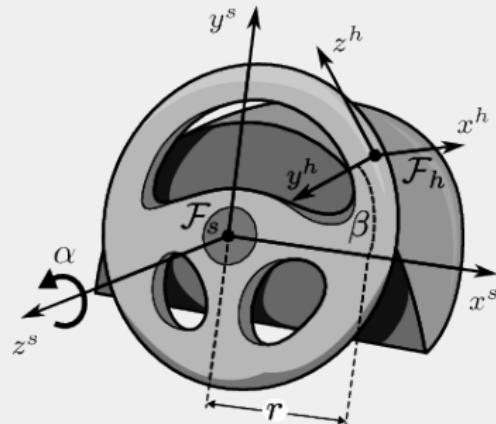

- **Classification:** predict **categorical** labels (discrete values)
- E.g., ImageNet: 1,000 object classes (categories), 1M+ images, labels are crowd-sourced

mite	container ship	motor scooter	leopard
mite	container ship	motor scooter	leopard
black widow	lifeboat	go-kart	jaguar
cockroach	amphibian	moped	cheetah
tick	fireboat	bumper car	snow leopard
starfish	drilling platform	golfcart	Egyptian cat

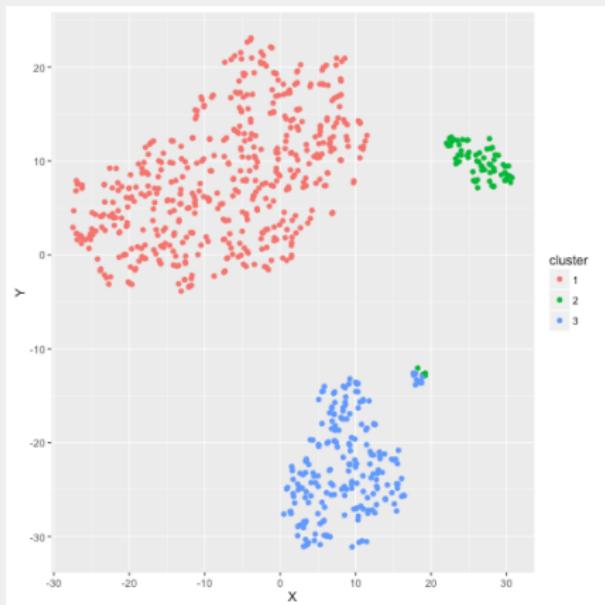

- **Regression:** predict **numerical** labels (continuous values)
- E.g., stock price, temperature, continuous control commands, etc.

23. 90	+12. 3%	▲	543. 23	120, 000
5. 89	+5. 34%	▲	254. 23	320, 000
6. 34	-7. 89%	▼	321. 56	430, 000
7. 34	+5. 97%	▲	100. 08	120, 000
8. 89	+2. 13%	▲	564. 23	900, 000
45	+6. 43%	▲	765. 90	600, 000
67	-11. 6%	▼	120. 34	380, 000
34	+23. 1%	▲	893. 23	120, 000
9	+5. 56%	▲	128. 98	320, 000
3	-8. 67%	▼	432. 12	75, 000
	+11. 3%	▲	765. 23	15, 000
42	+4. 2%	▲	400. 04	1, 000

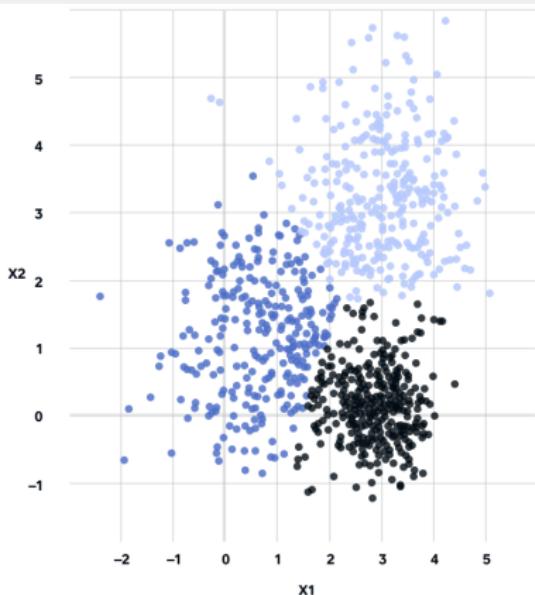

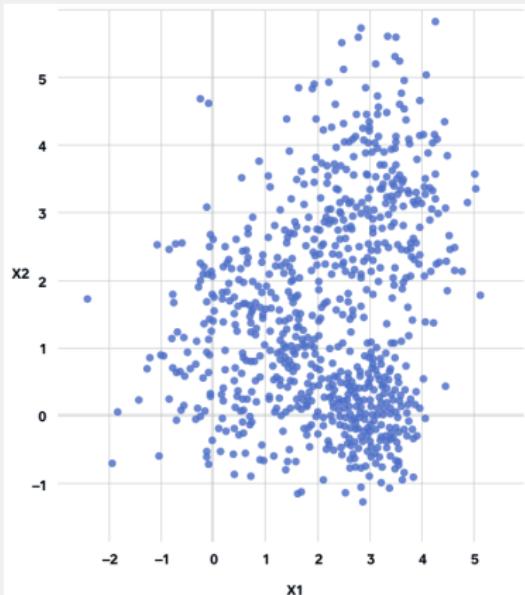

- Training set: train a model
- Validation set: tune a model through its hyperparameters
- Test set: test a model
- Example ratio: 6:2:2

- Assumption 1: training and test data are from the same distribution (the distribution is usually unknown)

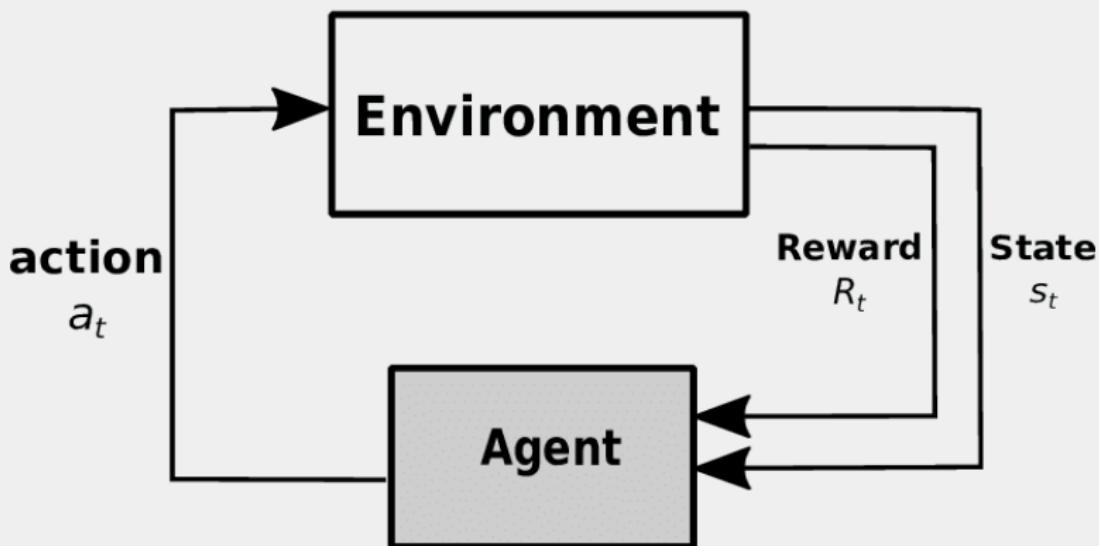

- Assumption 2: training and test data are i.i.d. (independent and identically distributed)

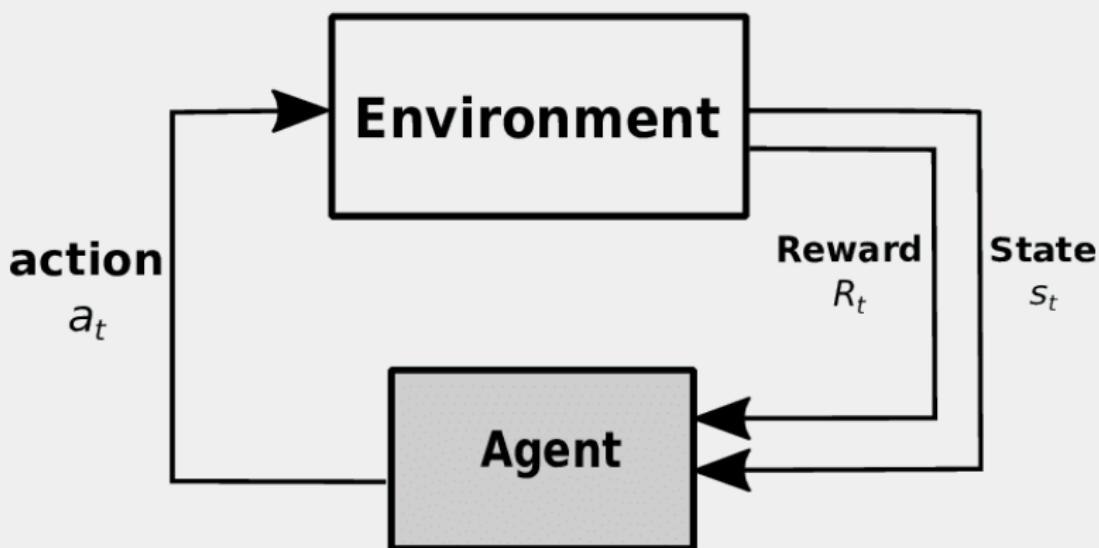

- Note: non-i.i.d. data may or may not break supervised learning

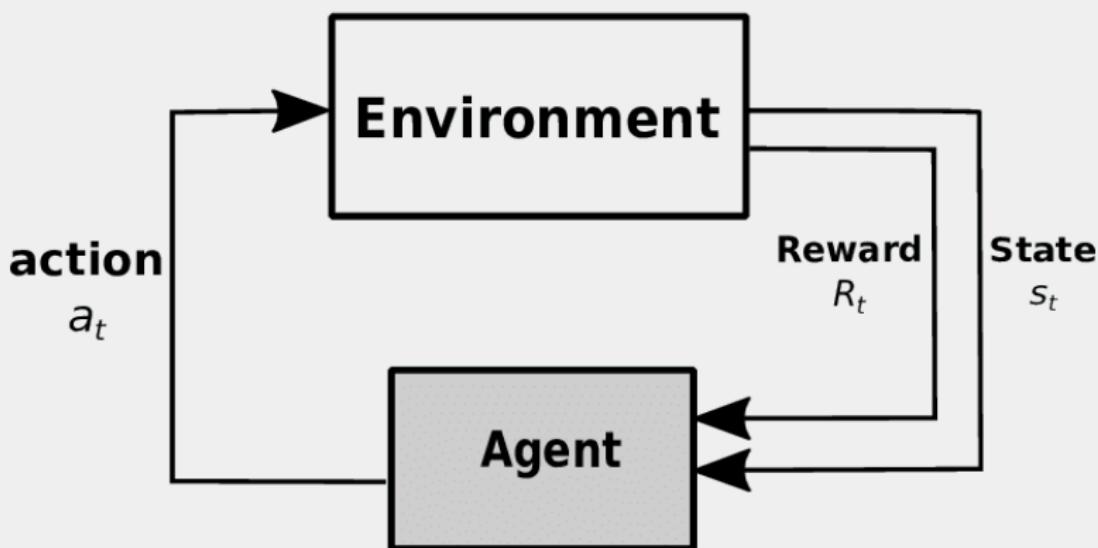

- Sequential decision making: interactions between **Agent** and **Environment**

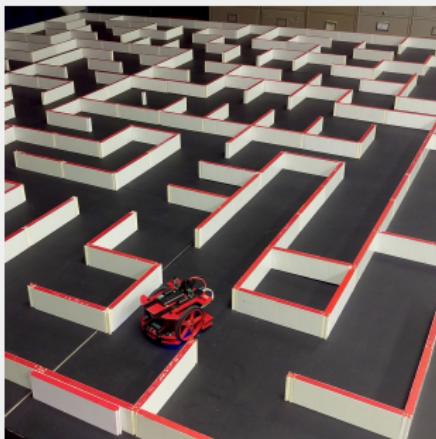

- Agent chooses an **action** to execute in the current **state** of Environment

- Environment provides **reward** to Agent and transits Agent to the next **state**

- Agent perceives its environment, performs a sequence of actions, observes their “rewards,” and learns an optimal policy
- E.g., Go, robot and maze, Atari game, etc.

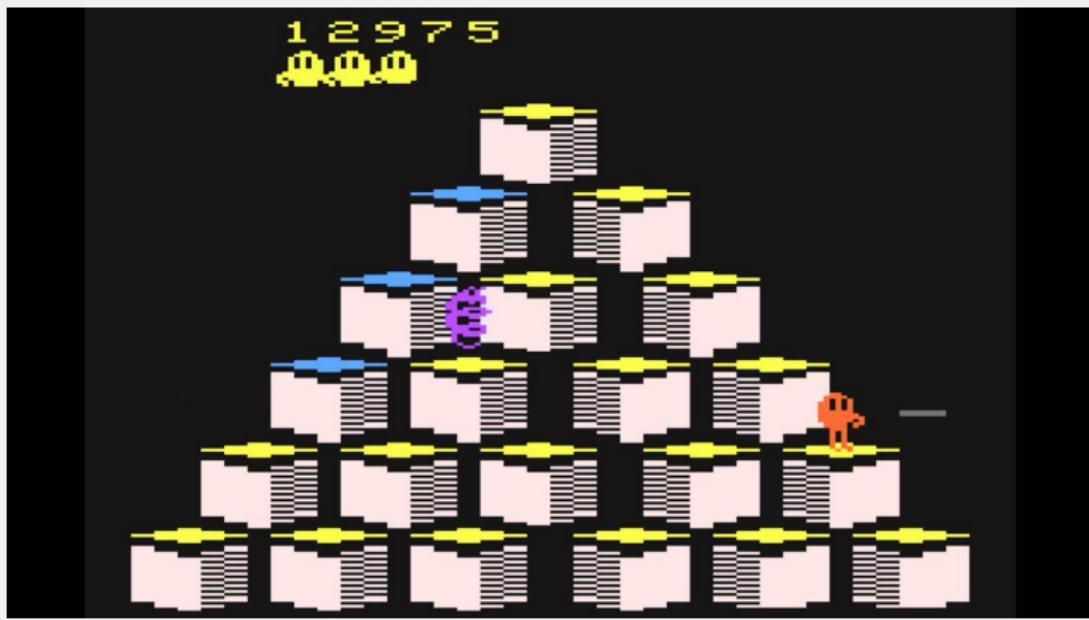

- Supervised learning
 - ▶ Solve the **recognition** problem
 - ▶ Assume i.i.d. data
 - ▶ Cannot pass human performance (i.e., ground truth)
 - Although for ImageNet: human 5% error, best model 3.57% error
- Reinforcement learning
 - ▶ Solve the **decision** problem
 - ▶ Learn via trial and error, no explicit supervisor only indirect, delayed feedback
 - ▶ Action order (time) matters → non-i.i.d. data
 - E.g., autonomous driving via a front-facing camera (image at t affects action at $t + 1$ then affects image at $t + 1$)
 - ▶ **Superhuman potential**

- Pros:
 - ▶ powerful (if works)
 - ▶ supervised learning is easy to set up, even without domain knowledge
- Cons:
 - ▶ blackbox (no human-interpretable features)
 - ▶ difficult to defend adversarial attacks
 - ▶ data hungry
 - ▶ computation intensive
 - ▶ hyperparameter search is tedious

- Steering angle prediction = 90k images + 3080 (GPU) + 16 hours

- Q-bert: DQN (algorithm) + 3070 TI (GPU) + 2-3 hours
